

This is a sample PDF document for testing the RAG PDF Chat system. This first page contains introductory text that explains the purpose of this document. The document will be processed by our PDF parser and then chunked into smaller pieces for vector storage and retrieval.

This is the second page of our sample document. It contains different content to test multi-page processing. The text chunking algorithm should preserve sentence boundaries and create overlapping chunks for better context preservation during retrieval.

Page 3

Page three includes technical information about the RAG system.

Retrieval-Augmented Generation combines the power of large language models with specific document knowledge. This approach allows for more accurate and contextual responses to user queries.
